

BS301

# AcoustiBS301

## Acoustics - Week

6-10-10

what reverberant sound is heard as an echo for speech?

anything over 40ms

what is the nominal sight height above any obstructions?

~90mm

raytracing angles

angle of incidence = angle of reflection

name some measures to prevent reverberant echos

1.use non-parallel walls 2.use absorbant rear wall 3.no aisle walkway along longitudinal axis 4.floor area & volume kept to a minimum

when do echos occur for speech/music

40ms for speech

100ms for music

why shouldn't use concave ceilings

creates uneven acoustic focus

define flutter echo

RAPID SMALL ECHOES following a short sound

beware of PARALLEL WALLS

avoid spaces with...

the depth exceeds twice the height - to prevent sound shadows

design rule of thumb for plant rooms

1. 5-20% of total floor area served by plant room

2.min 11m dimension on one wall

regardless of plant room size  
3.1% of floor area served for cross-section of both supply & return ducts  
4. boundary walls, floors, ceilings  $Rw50$

supply and return air should not exceed...  
37dB

where should silencers be positioned  
as close to the fan as possible

where are 4 places that noise can be generated within ducts  
1. obstructions  
2. sharp bends  
3. sudden enlargements or contractions  
4. silencers

cross talk occurs when  
two rooms are linked by common ductwork, a redesign of ductwork may be necessary

acoustic boot  
an air diverter, diverts air through insulation

noise from AC can come from 2 sources  
1. plant room - motors, compressors, AHUs  
2. duct borne - fan noise, airflow noise

what is a true scale of loudness  
SONE

one sone = \_\_\_\_\_ phons  
40 phons

an articulation index of 0.00 - 0.05  
would be  
confidential

an articulation index of 0.50 - 1.00  
would be  
nil

a normal articulation index is  
0.05 - 0.20

effective barriers require what surface  
density and cannot have...  
10-20kg/m<sup>2</sup>  
any gaps or holes

a barriers attenuation depends on its  
PATH LENGTH DIFFERENCE

four scales of community noise  
measurement  
Leq - equivalent continuous sound level  
Ldn - day-night average sound level  
(weighted Leq, +10db)  
Lax - single event noise exposure, eg  
Leq of 1 second  
Lx - noise level exceeded x% of time

how long can you be exposed to 130dB  
1 sec

how long can you be exposed to 100dB  
15min

how long can you be exposed to 85dB  
8hours

with every doubling of exposure (3db)  
what happens to the allowable daily  
exposure time  
it halves

according to SABINE what is a perfect  
reflector  
0

according to SABINE, what is a perfect  
absorber  
1

if a sabine number is bigger it is a  
better...  
ABSORBER

absorption of a surface is calculated  
by...  
surface area (S) x absorption coefficient  
( $\alpha$ )

sabine formula assumes that the sound  
in enclosure is...  
reasonable reverberant  
diffuse, sound has uniform directivity

when did sabine do his research  
1895-98 at Harvard

sound reflectors are dependant on  
size

reasonable minimum dimension for  
sound reflector  
3 x wavelength

sound absorbers are dependant on...  
1. porosity  
2. flow resistance  
3. structure factor  
4. mounting condition

what is the EYRING formula for  
reasonably DIFFUSE sound fields  
DEAD rooms

what is the FITZROY SABINE formula  
for  
NON-UNIFORM absorption  
relatively REVERBERANT rooms

what is the FITZROY EYRING formula  
for  
NON-UNIFORM absorption  
DEAD rooms

what is the ARAU-PUCHADES formula  
for  
NON-UNIFORM distribution of  
absorption

to work out the resonant frequency of a  
PANEL ABSORBER what formula  
resonant freq =  $6000/\sqrt{m.d}$   
m=mass of panel (kg/m<sup>2</sup>)  
d=distance between panel & wall (m)

if a change in resonant frequency is  
required for a PANEL ABSORBER,  
what can be done  
change mounting system, make tighter,  
less vibration

when calc traffic noise, what do you  
need to figure out BASE RATE  
1.base rate  
2.speed of traffic & heavy/light  
3.correction for gradient  
4.correction for surface

when calc traffic noise, what to you  
need for UNOBSTRUCTED  
1.base rate  
2.correction for surface (grass)  
3.correction for angle

when calc traffic noise, what to you  
need for OBSTRUCTED  
1.base rate  
2.correction for surface (hard)  
3.correction for angle  
4.correction for barrier

d' is what and when is it needed  
it the the DIRECT DISTANCE from  
OBSERVER TO ROAD  
height of receiver<sup>2</sup>+distance to road<sup>2</sup> =  
 $\sqrt{d'}$   
it is need when using the correction  
over SOFT GROUND

how many m/sec does sound propagate  
~344m/sec

how many dB increase is needed for a  
sound to become significantly louder  
8dB

a sound which has only ONE  
FREQUENCY is known as a  
PURE TONE

with sound propagation in air, when the  
DISTANCE DOUBLES  
the AMPLITUDE DROPS BY HALF -  
6dB

formula for RESONATOR ABSORBERS

resonator freq =  $c / (2 \times \pi) \times \sqrt{s / (l \times V)}$

where

c = speed of sound (m/s)

s = cross sectional neck area (m<sup>2</sup>)

l = length of neck (m)

V = volume of cavity (m<sup>3</sup>)

when is an ideal use for RESONATOR  
ABSORBERS

where there is a LONG  
REVERBERATION in a SINGLE  
FREQUENCY

RESONATOR ABSORBERS are most  
efficient at  
LOW FREQUENCIES

PERFORATED PANEL ABSORBERS  
are different than HELMHOLTZ  
RESONATORS because  
they are not as selectively absorbant

define PERFORATED PANEL  
ABSORBERS

a PUNCHED PANEL w an ENCLOSED  
AIR SPACE between the panel and the  
wall

what is dependant on a SOUND  
REFLECTORS size  
they have a LOW FREQUENCY CUT  
OFF dependant on their size, below  
which they act as DIFFUSES

name types of SOUND ABSORBERS

1.porous

2.PANEL ABSORBERS (thin membrane)

3.fissured ceiling tile on solid backing

4.RESONATOR ABSORBERS (helmholtz)

5.PERFORATED PANEL ABSORBERS

NOISE WITHIN AN ENCLOSURE

SPL = SWL +

$(10\log_{10}[(Q\theta/4\pi r^2)+4/Rc])$

where

r = distance from the source (m)

Q $\theta$  = directivity of source in direction r

S = surface area of room (m<sup>2</sup>)

Rc = room constant =  $Rc = Sa/(1-a)$

when you put a sound source close to ONE REFLECTING SURFACE, how much dB increase

+3dB

when you put a sound source close to TWO reflecting surfaces, how much dB increase

+6dB

when you put a sound source close to THREE reflecting surfaces, (trihedral corner) how much dB increase

+9dB

how much attenuation is there for each DOUBLING of the distance from the source up to 2m for OPEN PLAN offices

6dB

$-20\log_{10}(r)$

how much attenuation is there between 2-6m distance for OPEN PLAN offices

3dB

$-10\log_{10}(r)$

how much attenuation is there AFTER  
6m distance for OPEN PLAN offices  
6dB per DOUBLING OF DISTANCE  
 $-20\log_{10}(r)$

UNIDIRECTIONAL SPHERICAL  
SOURCE has whatdB attenuation at the  
end  
-11dB

UNIDIRECTIONAL HEMISPHERICAL  
SOURCE has whatdB attenuation at the  
end  
-8dB

sound waves at GROUND LEVEL travel  
SLOWER

SPEED of SOUND \_\_\_\_\_ with  
temperature  
INCREASES

In DAYTIME - HIGH temperature at  
ground level so  
sound travels FASTER at ground level,  
SLOWER HIGH UP

in NIGHT - LOW temp at ground level  
so  
sound travels LOWER at ground level,  
FASTER high up

the ARTICULATION INDEX is a  
measure of 0-1. What is 0 and what is 1  
0 - CONFIDENTIAL, can hardly hear  
conversation  
1 - NO PRIVACY, can hear everything

SPEECH PRIVACY depends on 3 things  
1.SPEECH LEVEL of the SOURCE  
2.NOISE REDUCTION achieved  
between source-receiver locations  
3.BACKGROUND noise level at the  
receiver location

there are two methods to ascertain  
ARTICULATION INDEX

- 1.with people
- 2.with computers

community noise can be assessed by  
TWO METHODS

- 1.sound level assessment
- 2.a police officer
