**New RT60 web app**

Some may find interest in an RT60 calculator web app that went live a week or so ago now. Its a departure from the spreadsheets we've all used and strives to be powerful and elegant. The calculator is not advised for small rooms, but rather those with a diffuse sound field. You may find value though in small rooms ensuring evenness of absorption across the frequency bands. The web app calculates Sabine, Eyring, Fitzroy, and Arau-Pruchades simultaneously, has a database of about 400 finish/mount configurations and growing, and a cool feature is dynamic ranging between unoccupied and occupied rooms. Register as a user to save or export as CSV.

More features for this calc and other tools are in various states of development and will be released in time. Feel free to let me know if you have any comments or constructive criticisms.

Best,  
Rob
